

#### Zero Waste as a vehicle to realise Green Economy in Southern Africa

#### **Prof Cristina Trois**

Dean and Head of School of Engineering University of KwaZulu-Natal, South Africa

**EXAMPLE 1** Chair of Southern Africa Regional Secretariat of UN-IPLA Programme and IWWG

IPLA Global Forum 2013 on Sustainable Waste Management for the 21<sup>st</sup> Century Cities - Building Sustainable and Resilient Cities through Partnership

City of Borås, Sweden, 9-11 September 2013

## Outline

IPLA Global Forum 2013 on Sustainable Waste Management for the 21<sup>st</sup> Century Cities - Building Sustainable and Resilient Cities through Partnership IPLA City of Borås, Sweden, 9-11 September 2013

Zero Waste as a vehicle to realise Green Economy in Southern Africa **Prof Cristina Trois** 

# In South Africa...

108 Mt total waste generated
 98 Mt waste landfilled
 10% approximate percentage of total waste that is recycled

# (Source: DEA, 2012)

IPLA Global Forum 2013 on Sustainable Waste Management for the 21<sup>st</sup> Century Cities - Building Sustainable and Resilient Cities through Partnership City of Borås, Sweden, 9-11 September 2013

Zero Waste as a vehicle to realise Green Economy in Southern Africa Prof Cristina Trois

## Waste Hierarchy

- According to the Danish Energy Agency, calorific value of waste is on average 10.5 MJ/kg
- This means that **4 tons of waste** can substitute **1 ton of oil** or **1.6 tons of coal**
- **1** ton of waste can produce **2** MWh for district heating and **0.67** MWh of electricity

# WASTE

#### RESOURCE

Component	Biodegradable?	Combustible?	Recyclable?

#### **CDM Landfill Biogas-to-Energy Project**

1<sup>st</sup> CDM Landfill Biogas-to-Energy Project in Africa

- Bisasar Rd landfill extracts approximately 350 m<sup>3</sup>/hour, Component 1 produces approx. 9MWh
- Mariannhill landfill -180 m<sup>3</sup>/hour is produced and an estimated 1775 m<sup>3</sup>/hour by 2024. Approximately 900 kWh of electricity is generated

IPLA Global Forum 2013 on Sustainable Waste Management for the 21<sup>st</sup> Century Cities - Building Sustainable and Resilient Cities through Partnership City of Borås, Sweden, 9-11 September 2013

Zero Waste as a vehicle to realise Green Economy in Southern Africa Prof Cristina Trois

#### Integrated waste treatment system

Zero Waste as a vehicle to realise Green Economy in Southern Africa Prof Cristina Trois

## **Material Recycling Facilities (MRF)**

#### **JOB CREATION POTENTIAL**

A small dirty-MRF processing 160 to 250 tpd can employ up to 150 on a full time basis 

IPLA Global Forum 2013 on Sustainable Waste Management for the 21st Century Cities - Building Sustainable and Resilient Cities through Partnership IPLA City of Borås, Sweden, 9-11 September 2013

Zero Waste as a vehicle to realise Green Economy in Southern Africa **Prof Cristina Trois** 

11

# **Biological – Composting**

#### VCU

**GiCom IVC** 

#### **Open windrow**

**ASP** 

- Throughputs- from 500tpa to 150,000+ tpa (scalable, expandable subject to technology)
- Cost of technology-Affordable, (cheap) subject to plant compliance requirement (ABPR) and configuration
- **Energy balance-**Does not produce energy, nett energy user

IPLA Global Forum 2013 on Sustainable Waste Management for the 21st Century Cities - Building Sustainable and Resilient Cities through Partnership IPLA City of Borås, Sweden, 9-11 September 2013

#### Food Wastes AD

#### **ANAEROBIC DIGESTION (AD) &**

#### Schematic Layout: Proposed Anaerobic Digestion (AD) Food Waste Treatment Plant (not to scale)

IPLA Global Forum 2013 on Sustainable Waste Management for the 21st Century Cities - Building Sustainable and Resilient Cities through Partnership

# **Biological – Anaerobic Digestion (AD)**

#### **Clarke-Haase**

#### Kuettner

IPLA Global Forum 2013 on Sustainable Waste Management for the 21<sup>st</sup> Century Cities - Building Sustainable and Resilient Cities through Partnership IPLA City of Borås, Sweden, 9-11 September 2013 UTS

- Throughputs- from 5,000~10,000 to 150,000+ tpa Subject to AD type, (scalable, expandable subject to technology)
- Cost of technology- Expensive, subject to plant compliance requirement (ABPR)
- Energy balance- Produces Biogas→Heat, Electricity, Vehicle Fuel, Industry,

#### JOB CREATION POTENTIAL

4 to 6 permanent jobs are created per ton of waste provided to an AD plant. An AD plant that treats 12k tpa (35tpd) could generate over 200 permanent jobs.

Zero Waste as a vehicle to realise Green Economy in Southern Africa Prof Cristina Trois

## **AD Bankability**

Factor to be	Wet AD	Dry AD (low solids)	Dry AD (high solids)
considered			
Typical feedstocks	Low solids liquid products, dairy products, food waste only, fruits and vegetable	Food waste, fruits, medium and high solids liquid products, some green waste	Food waste, green waste (as bulking agent), fruit and vegetable, putrescible high solid content products
Flexibility in feedstock fluctuation	Low	Medium	High
Ease of expansibility	Low /None	Medium	High
Scalability	High: from 1,000 tpa subject to technology	Medium: from 5-8,000 tpa subject to technology	Medium from 8-10,000 tpa
Footprint required	Low	Medium	High
Outputs	Primarily Liquid digestate	Liquid and solid digestate	Primarily Solid digestate
OPEX	High	Medium	Low

Example: AD Plant – 12k tpa may realise up to 0.5MWe at a total capex of some R30-40m (approx. 2-3m EURO).

#### **Project Structure**

#### **Project Programme**

Feasibility & Financing Development EIA Concept Design

Zero Waste as a vehicle to realise Green Economy in Southern Africa **Prof Cristina Trois** 

# **Thermal – Incineration or Pyrolysis and Gasification**

#### Basic Description

- Incineration is a thermal technology that involves <u>complete combustion</u> of waste with <u>excess air/oxygen</u> conditions
- Gasification and Pyrolysis are thermal technologies that involve <u>partial</u> <u>combustion</u> of waste <u>under reduced</u> or <u>no oxygen</u> conditions
- Throughputs- from 500 tpa to 150,000+ tpa (easily scalable, expandable)
- Cost of technology- Expensive, subject to plant *emission compliance* requirement and type of technology
- Energy balance- Produces energy (subject to syn-gas usage), Pyrolysis requires input energy

PLA Global Forum 2013 on Sustainable Waste Management for the 21<sup>st</sup> Century Cities - Building Sustainable and Resilient Cities through Partnership City of Borås. Sweden. 9-11 September 2013

# **EfW Bankability**

Technology Category	Continuous Gasification- Staged Combustion	Gasification with Plasma Conversion	Batch Gasification- Syngas generation or Staged Combustion		
Energy Generation Technology	Steam Turbines	Gas Engines	Steam Turbines or Gas Engines		
Typical Feed Preparation	Minimal/No Significant Requirements	Moisture Reduction and removal of Recyclables	Removal of non-combustible materials and significant size reduction for homogeneity in process		
Anticipated By- Products/Outputs	Bottom Ash – 12-15% wt Fly Ash – 8-10% by wt Includes particulate filter residues	Basalt like output – 12-15 % wt Scrubber Residue – 2-3% wt	Ash – 15-25% wt Includes particulate filter residues		
Energy Usage	Parasitic Load ~10-15% of generated capacity	Parasitic Load ~30-40% of generated capacity	Parasitic Load ~12-18% of generated capacity		
Energy Generation	Energy ~1.2 – 1.4MWe generated per tonne waste	Energy ~1.0MWe generated per tonne waste	Energy ~1.2 – 1.4MWe generated per tonne waste		
Scalability	Moderate flexibility from 50 to	Commercial scale ~100 to 200	High flexibility from 1 to 100		
	400+tonnes per day	tonnes per day	tonnes per day		
CAPEX	Moderate	Moderate to high	Moderate		
OPEX Moderate Moderate to high		Moderate to high	Low to moderate		

## **AD & EfW Bankability**

IPLA Global Forum 2013 on Sustainable Waste Management for the 21st Century Cities - Building Sustainable and Resilient Cities through Partnership IPLA City of Borås, Sweden, 9-11 September 2013

Zero Waste as a vehicle to realise Green Economy in Southern Africa **Prof Cristina Trois** 

IPLA Global Forum 2013 on Sustainable Waste Management for the 21st Century Cities - Building Sustainable and Resilient Cities through Partnership IPLA City of Borås, Sweden, 9-11 September 2013

Zero Waste as a vehicle to realise Green Economy in Southern Africa **Prof Cristina Trois** 

# **Scenario Analysis for Municipalities**

- Zero Waste Model
- Assist LAs in formulating sustainable WM strategies
- Resource recovery (i.e., waste-to-energy)
- Quantitative assessment of GHG reduction & landfill space savings
- Waste stream analysis: "knowledge gaps"
- Financial feasibility leading to scenario analysis

PLA Global Forum 2013 on Sustainable Waste Management for the 21<sup>st</sup> Century Cities - Building Sustainable and Resilient Cities through Partnership City of Borås, Sweden, 9-11 September 2013

#### **Dry-wet waste diversion model**

IPLA Global Forum 2013 on Sustainable Waste Management for the 21<sup>st</sup> Century Cities - Building Sustainable and Resilient Cities through Partnership

IPLA City of Borås, Sweden, 9-11 September 2013

Zero Waste as a vehicle to realise Green Economy in Southern Africa Prof Cristina Trois

Dean and Head of School of Engineering, University of KwaZulu-Natal, South Africa

22

WASTE	EVALUATION CRITERIA						
MANAGEMENT STRATEGY	Implementation Requirements	Technical Feasibility	Impacts to Environment & WM Systems				
Source Separation	Public Participation. Provision of separate bins, or refuse bags. Weekly collection services.	Source separation of paper employed in most areas of eThekwini, better service delivery is required.	Initial separation reduces contamination of waste (increases quality for other strategies such as anaerobic digestion).				
Landfill Gas Recovery	Landfill gas recovery systems & electricity generation equipment	Technically Feasible as landfill gas recovery has been implemented at eThekwini landfill sites	Reduction in emissions through energy production. Reduction of odours.				
Composting	Capital cost varies, depending on type of composting method. Separation of biogenics	Technically feasible: composting is a well developed process.	Production of compost, which reduces use of chemical fertilisers.				
Anaerobic Digestion	Significant capital investment. Separation of biogenics Legislation/Incentives. Creation of a market for AD products.	Many processes and technologies available. Potential for implement- ation under CDM.	Reduction in emissions through energy (biogas) production. Production of digestate for use as fertiliser or soil conditioner.				
Thermal Treatment	Significant capital investment. Separation of combustible waste.	Further research into technologies such as pyrolysis required - not widely implemented.	Reduction in emissions through energy recovery if implemented. Emission of pollutants & heavy metal particulates				
Recycling	Public participation. Greater incentives to strengthen recycling market.	Technically feasible. Recycling centres/prog- rams in place currently.	Preserves natural resources. Increased carbon sequestration.				
Mechanical Biological Treatment	Combination of AD/ composting & MRF separation processes.	As above for AD & composting. Feasible: MRF at Mariannhill landfill.	As above for recycling & composting/anaerobic digestion.				

## What is the W.R.O.S.E model?

- W.R.O.S.E. = Waste & Resource Optimisation Scenario Evaluation
- WM Strategies: landfill, landfill gas recovery, recycling, AD and aerobic composting
- Evaluates GHG emissions reductions from applying waste diversion strategies
  - Emission factors developed by the US EPA for WM strategies and together with an estimated emissions factor for AD
- Microsoft Excel Spreadsheet Interface

## **Anaerobic Digestion of Food Waste**

- Partnership: UKZN-Don't Waste Services-THRIP
- O.5 MW (12 MWh) AD Plant on Howard College Campus – to process 40-60 tons of macerated food waste and food processing waste per day
- Emissions reduction = approx. 18 000 tons of CO<sub>2</sub> eq. per annum
- Digestate/compost material = approx. 95 tons per month
- Partnership: DubeTrade Port-UKZN-THRIP (Dti)
- O.5 MW (12 MWh) AD Plant in the AgriZone to process 35-40 tons of macerated food waste and food processing waste per day
- Emissions reduction = approx. 15 000 tons of CO<sub>2</sub> eq. per annum
- Digestate/compost material = approx. 95 tons per month

# **Energy Recovery from Farm Waste**

#### Biomass potential in KwaZulu-Natal, South Africa

High levels of animal husbandry with poor waste management practices

- □ Significant quantities of organic waste available
- Significant potential to reduce current GHG emissions
- Paradigm shift: Waste as an opportunity!

IPLA Global Forum 2013 on Sustainable Waste Management for the 21<sup>st</sup> Century Cities - Building Sustainable and Resilient Cities through Partnership IPLA City of Borås, Sweden, 9-11 September 2013

Zero Waste as a vehicle to realise Green Economy in Southern Africa Prof Cristina Trois

## **Anaerobic Digestion of Food Waste**

- Prefeasibility study conducted using Induced Blanket/Bed Reactor AD Plant and industry standards for Biogas production from cow manure
  - Biogas used to run gas powered electrical generators electricity used for farm/dairy operation (financial benefit)
  - Reduced GHG emissions
- NOT Financially feasible under baseline assumptions
  - Cows kept in open pastures (no waste collection), and rotary dairy system highly efficient (low level of waste collection)

![](_page_41_Picture_6.jpeg)

Advanced Rotary Dairy system with cow retention time of approx. 11 minutes

![](_page_42_Picture_0.jpeg)

#### Prefeasibility Assessment – Piggery AD Plant in Ashburton, KZN

- 5000 pigs producing approx.
  9000 tonnes of wet organic
  waste per annum
- Biogas yield of 694m<sup>3</sup> per day
- Energy output per year approx.342 168 kWh

#### FINANCIAL FEASIBILITY IDENTIFIED

Energy cost offset = internal rate of approx. return 7%

#### Waste-to-energy in rural SA

- Case study UKZN-WRC Project (k5/1955)
- New application to LOTTO for 10 small AD plants (Mkuze Game Reserve)
- Objective: improve living standards in rural households through integrated waste, water and energy sustainable technology solutions
- Integrating rainwater harvesting, livestock fodder production and biogas generation in rural areas of South Africa
- 4 pilot study households in each province

Zero Waste as a vehicle to realise Green Economy in Southern Africa Prof Cristina Trois

#### **Conclusions**

- Need for GIS mapping of regional landfills
- Comprehensive waste stream analysis and carbon footprint assessment required to develop projects
- Need for an integrated sustainable waste management decisionmaking framework for local authorities
- Need for ad hoc capacity building within municipalities
- Scenario and Technology Assessment (through the use of tools like WROSE) prior to financial commitment, towards a sound bankable feasibility report
- Streamline success of projects through the creation of synergic special purpose vehicles between private and public actors
